

METEOP

Modelling Exposure Through Earth Observation Re

An Introduction to Exposure

This section will introduce key concepts to the audience, such as resolution of data, the difference between aggregated and building specific data, and what is key for assessing vulnerability.

Earthquake Safe Communities in Nepal

Major “take-aways”

- What is exposure data and how is it used in the loss estimation process?
- The Basic Process of Developing Exposure Data
- The Value of EO Data
- How to check your exposure data and ensure that it is fit for purpose?

Oxford Policy Management

Exposure modelling is the art of distributing inventoried people into buildings

- Given the number of people, how many households
- Given households, how much dwelling area?
- Given how much area of dwelling, how many buildings? How does this change in space?

Levels of Exposure data, and scale

<https://meteor-project.org>

British Geological Survey

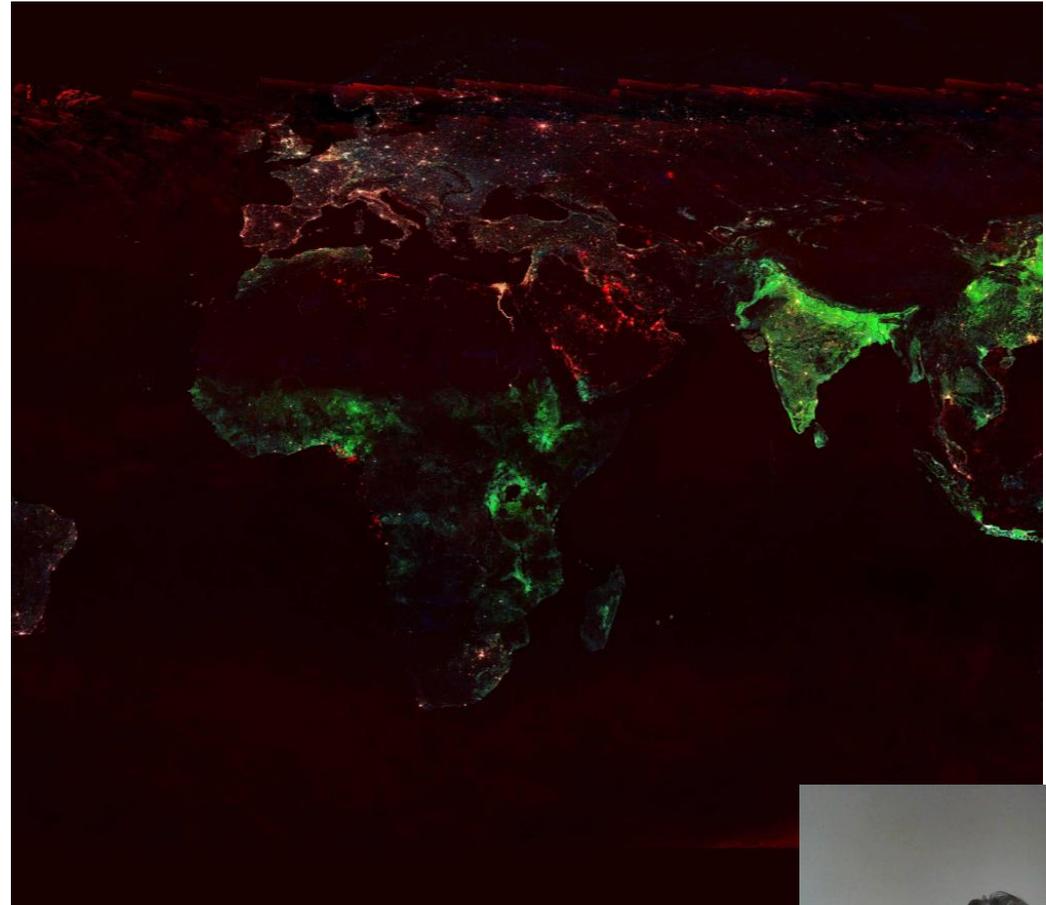

Level 1- Global data

Typically global but can be continental or regional

Country-specific information minimal

Aggregate of aggregates

<https://meteor-project.org>

British Geological Survey

NSET
National Science and Technology Center

Oxford Policy Management

Level 2- Country-level exposure data

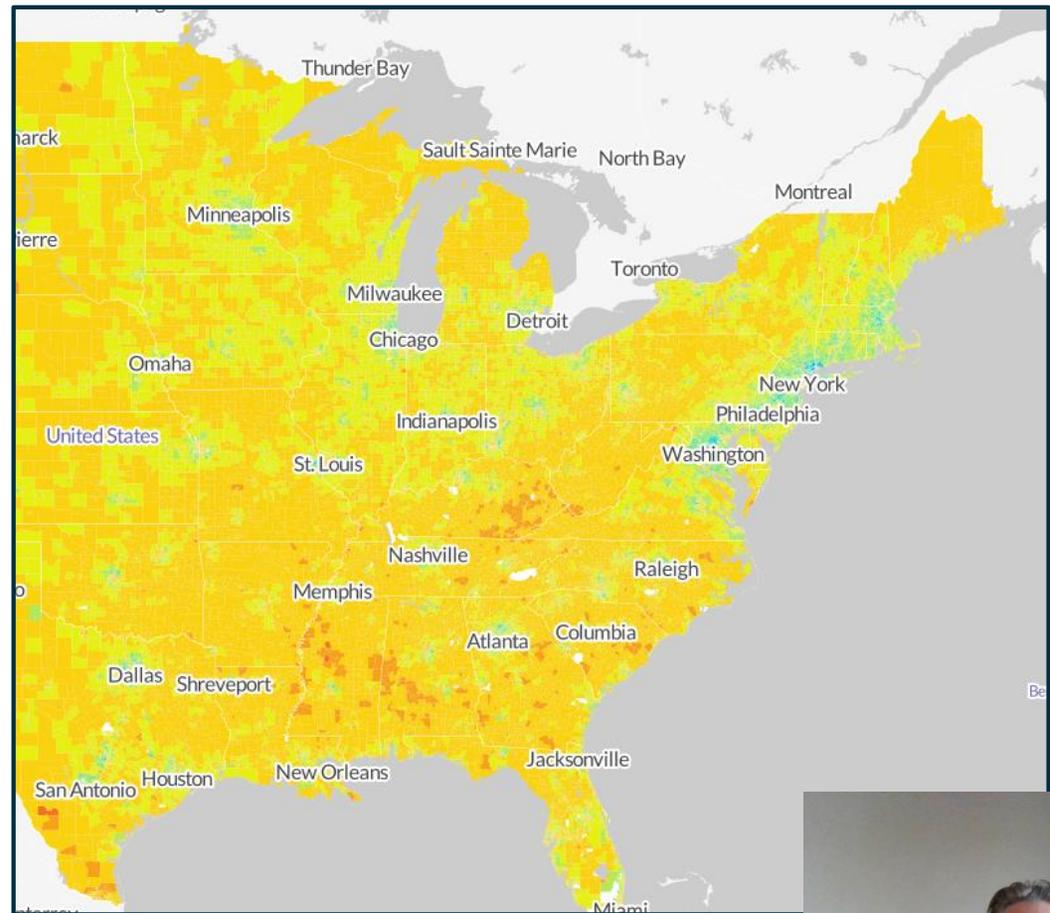

Exposure data has been collected and reviewed at a national level

Structure type distributions

Number of people per household

Household size

Building replacement cost per square meter

<https://meteor-project.org>

British Geological Survey

NSET

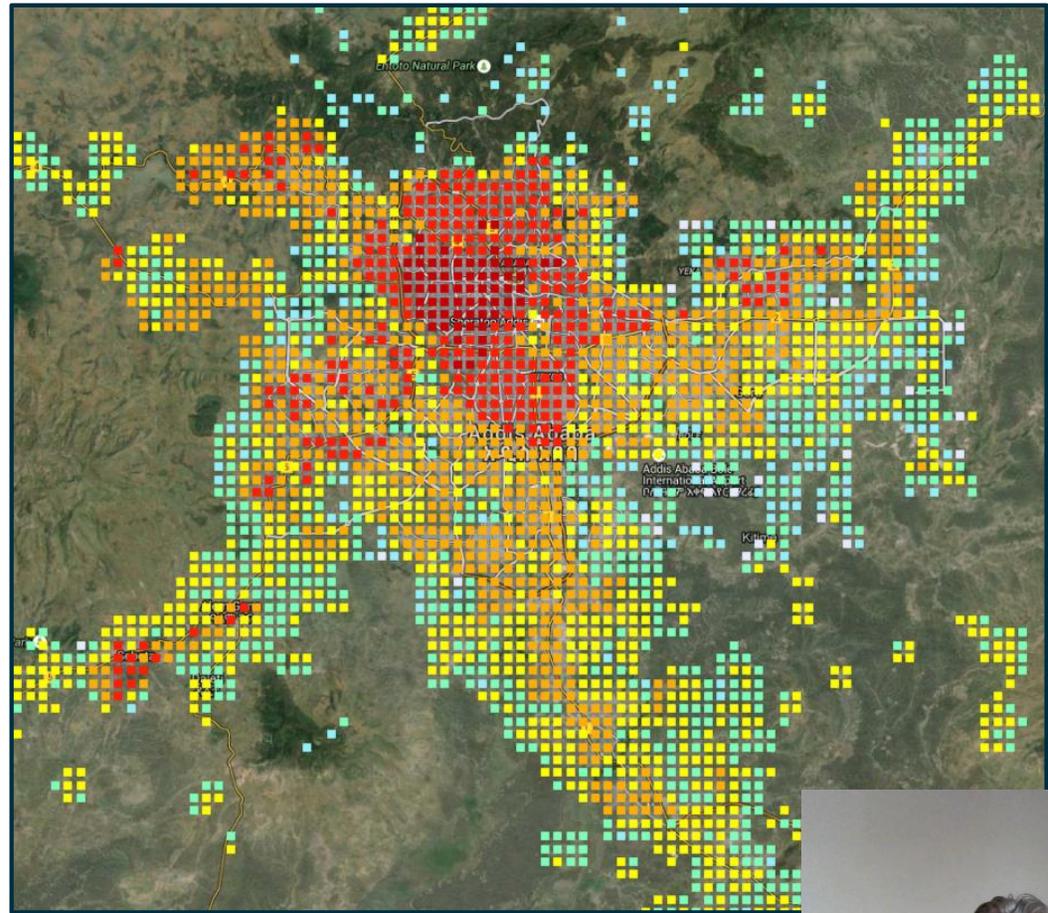

Oxford Policy Management

Level 3- Data improvement at the sub-national scale

Examples:

1. Subdividing the country by climate or cultural regions to reflect construction patterns
2. Identifying major urban areas and enhancing building counts or structural mapping schemes in these areas

<https://meteor-project.org>

British Geological Survey

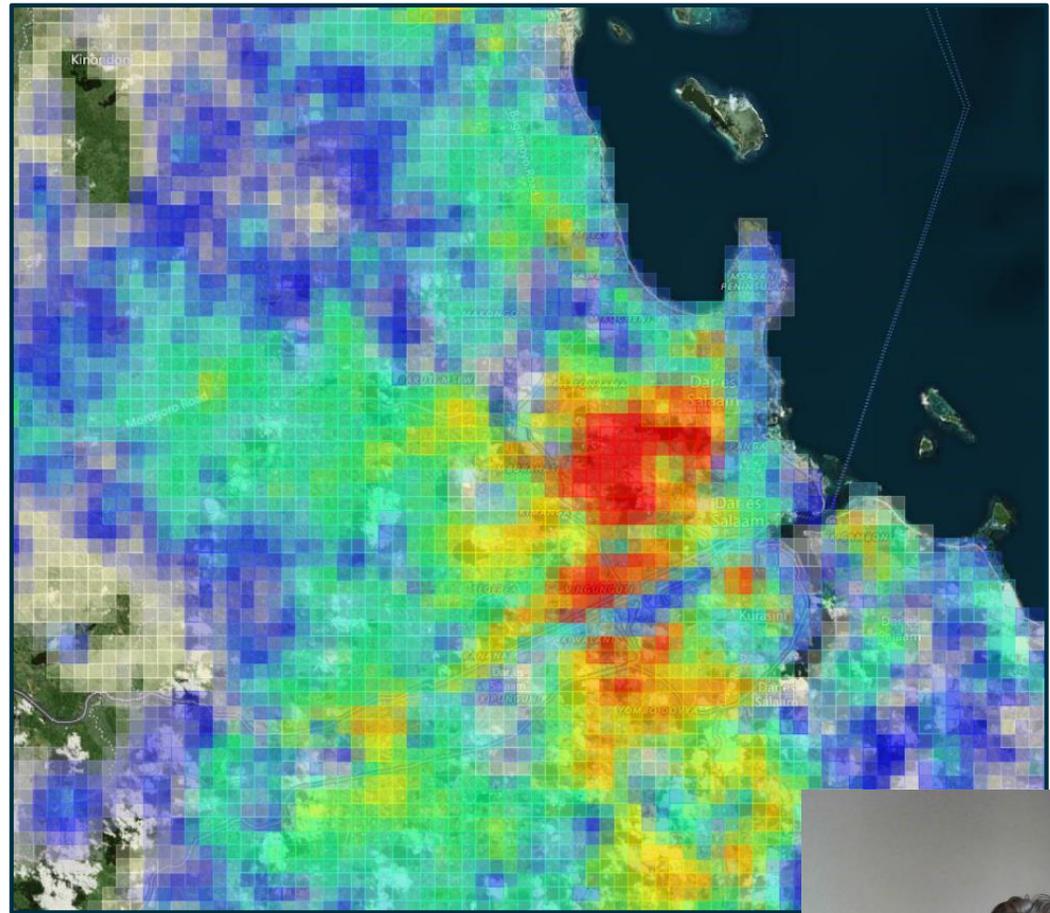

NSET
Ethiopian National Science and Technology Center

Level 4- Aggregated building specific data

Advantage: Aggregating the data allows for structural and occupancy distribution, height distribution and other attributes will not be mistaken for point-specific data

Disadvantage: spatial accuracy is lost

<https://meteor-project.org>

British Geological Survey

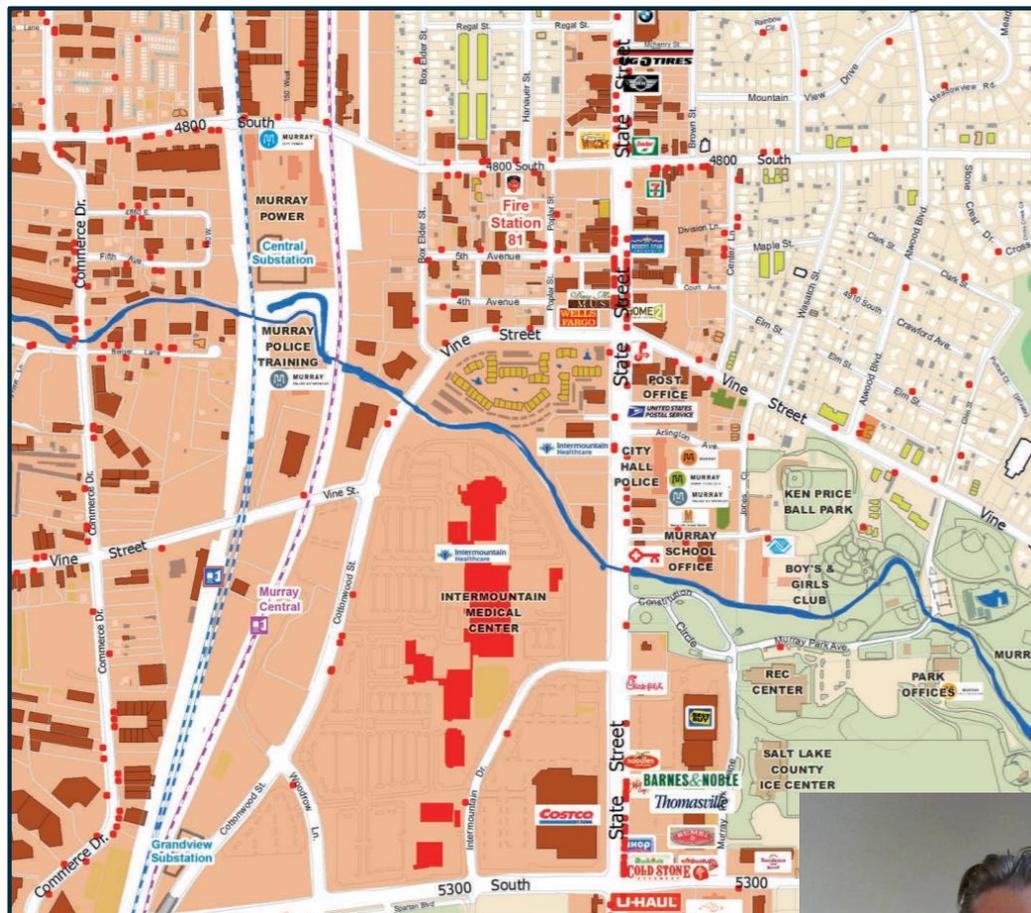

NSET
Earthquake Safe Communities in Nepal

Level 5- Site-specific data

All data provided at the site level

National Security Emergency Training

Oxford Policy Management

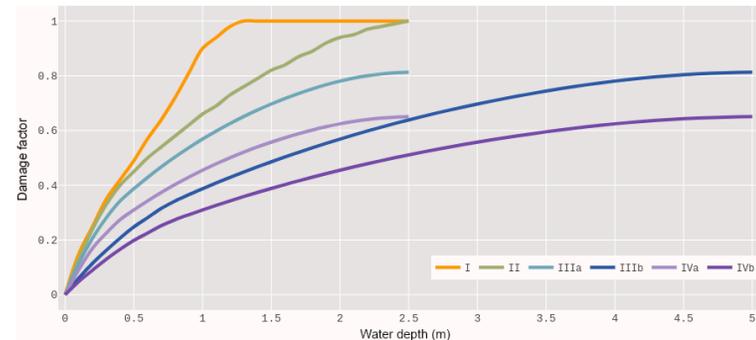

Spatial resolution

Building vulnerability attributes

- Number of stories
- First floor elevation
- Structural materials
- Lateral force resisting system
- Retrofits
- Nail density
- Distance between buildings

<https://meteor-project.org>

British Geological Survey

NSET
Bardicivale Safe Communities in Naples

Replacement costs

- What is it?
- Typical
- Tricky
- Not always meaningful
- Can correlate with income

Vintage

- Often ignored
- Can lead to issues in areas with lots of growth
- May not be a big deal if results are “relative”

<https://meteor-project.org>

British Geological Survey

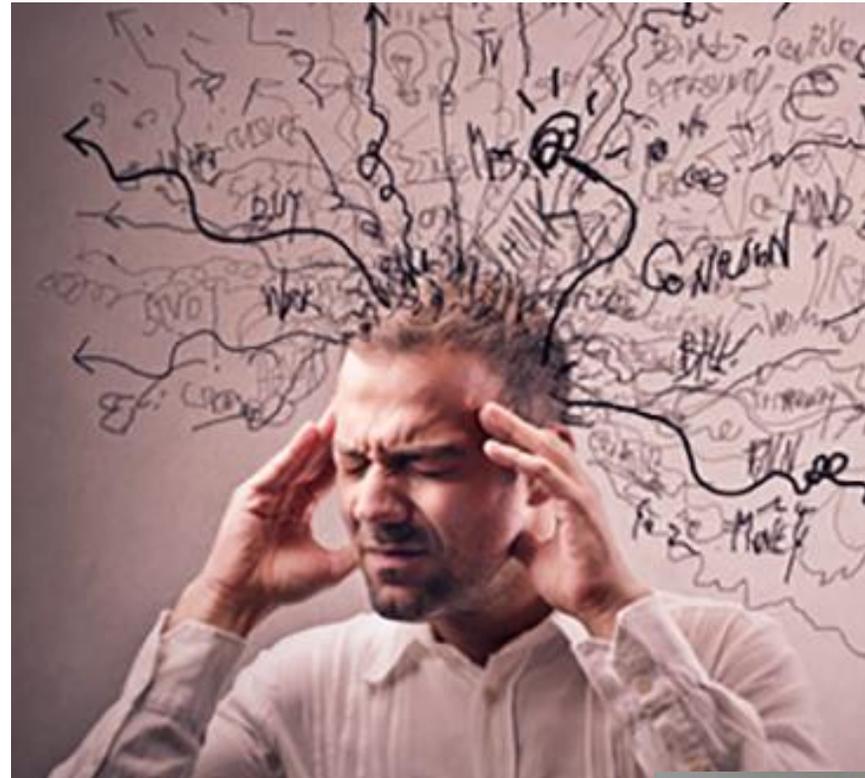

NSET
National Science Foundation

Oxford Policy Management

Challenges

- Data Availability
- Permissions
- Processing challenges
- Bias
- Human error
- Data gaps
- Misperception
- Accuracy
- False precision
- Explaining the data with clarity
- Inappropriate legacies
- Turnover
- Obsolescence
- Advancing technologies (AI, UAV, additional sensors)

Oxford Policy Management

Expectations

- Cannot typically expect accurate number of buildings at the cell level – count is approximate
- Can expect more accuracy than in the original base data sets
- Cannot expect to always capture small unmapped rural areas
- Challenges in remote sensing that will impact results (low lights, cloud cover, tree canopies etc.)
- Can not repurpose the data for civic purposes such as address-specific information for tax purposes
